

Emergency Trailer Braking System

For Agricultural Trailers with Hydraulic Brakes

Kit Part Number: **ETK001**

The ETK001 Emergency Trailer Braking System fits any drawbar trailer with hydraulic brakes and is designed to apply the trailer brakes if there is a sudden loss of connection between the tractor and the trailer, in the event of a breakaway for instance.

An emergency accumulator containing pressurised hydraulic fluid is fitted to the trailer. Also fitted to the trailer, on the drawbar, is an emergency brake valve. On the back of the tractor is a steel cable, the other end of which is loosely connected to the operating lever on the valve. If the tractor parts company with the trailer this cable is pulled tight, rotating the operating spindle on the valve and allowing pressurised fluid from the emergency accumulator to apply the trailer brakes. The operating lever also functions as a quick-release clip and is pulled clear as tension on the cable increases. The accumulator is then recharged once the braking system is reconnected and the valve is reset to its normal running position.

For more information, please contact our technical department on 01522 720065.

All the items shown in the picture are included in the kit.

Hydraulic hoses are also required and can be ordered to length.
